

PROJECTS

Location: Kent

Business Type: Printing

Project: Site to Site Data Backup

Our customer, a key stationary and forms supplier to the NHS, operates from multiple sites in Kent.

Following investment in new systems at the major office locations to support a specialist Printing Management Information System (MIS) for the Group, the opportunity was taken to improve their data protection by using the Wide Area Network (WAN) link between sites to automatically distribute backup images to their own remote locations.

This has saved considerable time, effort and administration by removing the daily process of a nominated person at each location having to manually 'rotate' their overnight snapshot backup media away from site.

Additionally, the fact that up to date backup data is immediately available from a Network Attached Storage (NAS) device at an alternate office means that in the event of a serious issue affecting a site, work can immediately commence recovering to contingent server hardware so business continuity can be maintained and a significant step toward Disaster Recovery (DR) is achieved.
