

PROJECTS

Location: South East London

Business Type: Architecture and Surveying Practice

Project: Computer Aided Design (CAD)

Our client is a nationally recognised multi-discipline property services practice with offices in North and South East London.

They employ a large team of Architects and Interior Designers who are dependent upon high performance Computer Aided Design (CAD) systems to support multi-million pound pre-tender concept visualisations, high-quality submission graphics, and post award 2-D and 3-D design and construction drawings.

Network Computing plays a major role in maintaining exemplary performance and availability from these key workstations and large-format graphic output devices, and manage interconnectivity and the associated data security implications of the increasing multi-party collaborative working relevant to the scope of scale of their construction projects.
